The reports provided by our Research Center are powerful, providing the data and insights required by institutions, policymakers, researchers, and legislators across the country who seek a solid basis for their decisions. However, those products are limited by their need to service many stakeholders swiftly and consistently, while producing outcomes that do not vary from tightly defined inputs.

**Custom Research** from the National Student Clearinghouse provides researchers and education stakeholders with a way to take advantage of the Clearinghouse’s decades of deep data resources and analytical capabilities.

**Custom Research** at the Clearinghouse provides researching entities an alternative route. When your outcomes need to be split in a different way, when your cohorts need a different construction, when you need to work with different definitions to apply national numbers directly to your research, this is where Custom Research can step in.

The conversation starts by reaching out at customresearch@studentclearinghouse.org
Over the past decade, the Clearinghouse has created a wide range of custom research projects and worked with all types and sizes of clients, from grad students working with small grants to some of the largest foundations in the United States and nearly every kind of researcher in between.

**How It Works**

1. Contact us at customresearch@studentclearinghouse.org to begin the conversation

2. Discuss your questions and needs with our Custom Research team to help us determine if and how we can help

3. Work with our team to design the project – from data universe to definitions and rules to the outcomes to be produced – while remaining mindful of time and budget constraints

4. Finalize agreements and schedule, and remain available for clarifications and comments as the work is performed

**Past Projects Types Include**

- Specialized variants of the National Student Clearinghouse Research Center’s public reports
- Rapid reporting on student enrollment levels in general, or by geography, by field of study, by demographics, or a number of other traits
- Pathways reporting, helping professional organizations and industry leaders understand both how many individuals are entering their fields and where they are coming from
- Deep longitudinal outcomes tracking educational behaviors over long periods
- Generating anonymized data sets merging education data with outside data (such as financial or military service) enabling deeper analysis of potential relationships
